1.0 Introduction

The Southwest Association of Freshwater Invertebrate Taxonomists (SAFIT) is charged through its charter to develop standardized levels for the taxonomic identification of aquatic macroinvertebrates in support of bioassessment. This document defines the standard levels of taxonomic effort (STE) for bioassessment data compatible with the Surface Water Ambient Monitoring Program (SWAMP) bioassessment protocols (Ode, 2007) or similar procedures. The STE is based on our current understanding of macroinvertebrate taxonomy, and this document was prepared following the STE Rules (Rogers & Richards, 2006). This list includes aquatic taxa found in streams and lakes primarily in California as well as surrounding states and ecoregions. It must be emphasized that this document is grey literature, and does not supercede any peer-reviewed literature. This document is a compilation and distillation of data gleaned from the peer-reviewed literature, museum records, the input of various taxonomic experts, and the ABL database. Specialized references are suggested for some taxa, however this document is not a procedural guideline, but rather a list of defined, reproducible endpoints. For the latest version of the STE document and for other Bioassessment resources, visit the link on the California Aquatic Bioassessment Workgroup (CABW) website (www.dfg.ca.gov/cabw/cabwhome.html). At present, the link is under the heading “CAMLnet”.

This STE list should not be interpreted as a comprehensive list of the aquatic macroinvertebrate fauna of the southwestern United States, although such a list is being developed by SAFIT. This STE list includes the macroinvertebrate taxa encountered in bioassessment samples as of the date of this revision, together with literature records from published taxonomic literature. The higher level taxa in this list (Phylum through Order) are organized hierarchically to reflect phylogenetic relationships, while Family through Species are listed alphabetically. The higher taxonomy of the Arthropoda is currently a subject of debate. Therefore, for this version of the STE List we have maintained a more traditional presentation of the superordinal tiers of the Arthropoda.

This information will be integrated into the SWAMP database and the California Environmental Data Exchange Network (CEDEN). Any suggestions for modifications of this list should comply with the STE Rules, and be sent to the attention of Austin Brady Richards, CDFG Aquatic Bioassessment Laboratory (arichards@csuchico.edu) or D. Christopher Rogers, EcoAnalysts, Inc. (crogers@ecoanalysts.com) or any member of SAFIT’s Standard Taxonomic Effort committee (see STE Rules, sections 2.2 and 2.6).

For definitions of the terms used in this document, please refer to Appendix II of the Rules document.

1.1 Acknowledgments

We want to thank the SAFIT membership for their cooperation and their role with SSCWRP in formalizing SAFIT. We gratefully acknowledge SWAMP for support and funding in this endeavor. We especially would like to thank the following persons for reviewing sections of the STE list: Allison Brigham (Lepidoptera), Eric Chapman (Haloplidae), Doug Post (Dytiscidae), John Sandberg (Plecoptera), Joe Slusark (Ephemeroptera), Cheryl B. Barr (Byrrhoidea), William D. Shepard (Byrrhoidea), John T. Polhemus (Hemiptera), David E. Ruiter (Trichoptera), Andrew Rehn (Odonata), Rosser W. Garrison (Odonata), Norman Penny (Megaloptera and Neuroptera), Brian J. Krestian (Chironomidae); Rafael Mazor, Jonathan Lee, Tom King, Robert W. Wisseman, Dave Herbst and Michael Bogan of SNARL, and Peter Ode each provided detailed general reviews. We would like to thank Chris Rosamond, John Epler, Martin Spies and Peter S. Cranston for their input on the California and Nevada chironomid fauna. We would also like to thank Teresa Richards for her assistance with the formatting of this document.

2.0 Standard Taxonomic Effort

The goal of this document is to standardize levels of taxonomic effort among labs conducting the SWAMP bioassessment protocols or similar protocols. For benthic macroinvertebrate (BMI) datasets to be compatible, taxa need to be identified to a common, reproducible level, thus SAFIT defines levels of taxonomic resolution for all labs performing the SWAMP; i.e. the standard taxonomic effort or STE).

2.1 Rules for Developing a Standard Taxonomic Effort

Earlier versions of this document were developed by the predecesor of SAFIT, the California Aquatic Macroinvertebrate Laboratory Network (CAMLnet). During the recent reorganization of CAMLnet into SAFIT, SAFIT membership identified a need to formalize the rules for standardizing the reporting of taxonomic data used in bioassessment. This discussion led to the drafting of the first version of a rules document to accompany the STE (Rogers and Richards, 2006, herein after referred to as the STE Rules). This document defines SAFIT's rules for the validity of taxonomic names and provisional taxa, their use and reporting format in bioassessment datasets. The STE Rules document also outlines the procedures and criteria for subsequent revisions of the STE list with the proposed formation of an oversight committee for the STE.

2.2 Changes from the Previous Version

This STE has been entirely reconstructed since the previous version (revision 27 January 2003). Some text portions and standards have been taken from the

previous version (most notably the Acari section). Specific modifications include the format, updated taxonomy, the addition of habitat information (benthic, lotic vs. lentic and estuarine habitats), and distribution information for California and surrounding states. For many groups, this information is preliminary and is meant as supplemental to the taxonomic information given for each group. The tolerance values and functional feeding group information has been excluded from this document. Plans are underway to revise much of this work and include the information in a separate document.

2.3 The SAFIT Standard Taxonomic List

A practical level of standard effort is determined by cost-effectiveness of identification relative to effort. Obviously, cost-effectiveness is highly dependent on taxonomic skills, but it is also determined by the availability of accurate keys and peer reviewed literature, and the degree of special methodology (e.g., slide mounting) needed to identify taxa.

Some bioassessment programs use the availability of species keys to establish standard levels of effort, and for some taxonomic groups we do provide references to species keys where they exist and if they meet the requirements of the STE Rules. However, under the SWAMP, the objective is to identify all taxa to a relatively even level of taxonomic effort. At the time of the previous revision of this list, two levels of standard effort were defined. Level I roughly corresponds to genus level identifications for all groups (where possible) except for the Chironomidae which are taken only to family and monotypic taxa which may be taken to species. Level II roughly corresponds to species level identifications for most groups and genus level identification for the Chironomidae. Taxonomic levels of effort (and exceptions) are listed for each group.

3.0 Methods and Materials

We prepared a list of the benthic macroinvertebrates relevant to the SWAMP bioassessment protocols or similar procedures. All data was compiled based upon the standards presented in the Rules document. All accessible pertinent peer-reviewed literature was reviewed for relevant taxa and distributional records.

This document is grey literature, and does not supercede any peer-reviewed literature. It is a compilation and distillation of the peer-reviewed literature, museum records, the input of various taxonomic experts, and the ABL database, as follows the standards in the Rules document.

3.1 Habitat Information

The primary focus of this list is benthic macroinvertebrates. A few non-benthic taxa have been included and are marked as such. In future versions of this list, it is hoped that guidance on the taxonomy of all aquatic and semiaquatic invertebrates can be included. Basic habitat association (lotic, lentic and estuarine) has been included for the various taxa. This section is still under construction and will be further developed in subsequent revisions.

3.2 Geographic Scope

The STE began as a guidance document for California only. As the California Aquatic Macroinvertebrate Laboratory Network (CAMLNet) evolved into SAFIT, the area of coverage increased to include the Southwest in general. The STE has been expanded to include California and adjacent states. Washington was also included since many aquatic invertebrates have distributions ranging from California to Washington in the Cascade and Coastal Ranges. Some information has been given for distributions in Baja California as well. It is hoped that future revisions of this list will flesh out these distributions and add other sections of the southwest. All distribution information has been gathered from the peer-reviewed literature, museum records and the ABL database. Thus, this list is not meant to be a checklist for any of the groups therein, but simply a summary of available distributional information. Future revisions of the STE may include distributional updates based on bioassessment surveys and should not be taken as peer-reviewed published data by itself. This document is grey literature. We also stress that identifications should not be based solely on distribution.

3.3 Abbreviations in the STE list

CA=California, OR=Oregon, WA=Washington, NV=Nevada, AZ=Arizona, Baja=Baja California (at present this term doesn't distinguish between Baja California Norte and Baja California Sur); "X"=published distributional or habitat records, "?" unpublished, but known distributional or habitat records.

3.4 Life Stage Terminology

The information in the STE list primarily deals with those life stages of invertebrates that are aquatic. Some additional information is given for the terrestrial life stages. The term "larva" (plural: larvae) has historically been applied only to the immature, pre-pupal stage of holometabolous insects. However, in recent years, the term larva has also been applied to the immature or "nymph" stage of hemimetabolous insects. Both terms may appear in this document, although the compilers of this present edition prefer to reserve the name nymph for the immatures of hemimetabolous insect orders (Ephemeroptera,

Odonata, Plecoptera, Hemiptera) and use the name larva in association with the holometabolous orders (Megaloptera, Trichoptera, Lepidoptera, Coleoptera, Diptera).

4.0 Rare, Threatened and Endangered Species

Rare, threatened and endangered species are defined to include aquatic macroinvertebrate species listed as threatened or endangered under the federal Endangered Species Act (ESA) (50 CFR 17.11 for listed animals and various Federal Register notices for proposed species), the California Endangered Species Act (CESA), and the California Environmental Quality Act (CEQA). This does not cover aquatic macroinvertebrate species listed under state law in adjacent states. Rare, threatened and endangered species are afforded various levels of protection under the aforementioned laws. Any individual, private company or agency that violates these laws may be subject to substantial fines, imprisonment, or both. Inclusion of names of rare, threatened and endangered aquatic macroinvertebrates in this document and the STE list is meant to be strictly informative and in no way authorizes collecting or harming these taxa without proper permits.

Rare species are species that may be given some protection under CEQA depending upon the action being reviewed under a specific CEQA document. These species typically are not protected, however they may at any time become listed under CESA or ESA.

Threatened species are species that are partially protected under CESA and ESA. While it is illegal to collect, harm, harass, or kill threatened species, some activities may still be legal (varying depending on the species) without the requirement of permits.

Endangered species are fully protected under CESA, CEQA and ESA. It is illegal to collect, harm, harass, or kill endangered species without the appropriate state Memorandum of Understanding and/or federal 10(A) 1(a) permits.

APPENDIX I

THE SAFIT STANDARD TAXONOMIC EFFORT LIST

Porifera

Phylum: Porifera

Standard Effort Level I: Phylum

Standard Effort Level II: Phylum

Standard Taxonomic Reference: Frost et al. (2001)

Reviewed by:

The Porifera are generally identified using Frost et al. (2001). Poriferans are not typically enumerated as a quantitative part of benthic samples, as they are colonial and sessile. However, their presence in samples should be noted, as most species are indicators of clean, well oxygenated water.

Taxonomic Hierarchy	Habitat					Distribution					Literature Cited	Comments	
	Phylum	Benthic	Lotic	Lentic	Estuarine	CA	OR	WA	NV	AZ	Baja

Nemata

Phylum: Nemata

Standard Effort Level I: excluded from benthic datasets

Standard Effort Level II: excluded from benthic datasets

Standard Taxonomic Reference: Poinar (2001)

Reviewed by:

Nematoda is now considered to be a junior synonym of Nemata Cobb, 1919 (Brusca and Brusca, 2003). Nematodes are typically left at phylum. The vast majority of freshwater nematodes are not large enough to be considered “macroinvertebrates”. Typically, the only “macro” nematodes encountered in benthic samples are in the family Mermithidae, which are parasitic on dipterans and ephemeropteryans. As they are parasites, they are of little ecological importance. (See STE Rules section 3.4.3)

Taxonomic Hierarchy	Habitat					Distribution					Literature Cited	Comments	
	Phylum	Benthic	Lotic	Lentic	Estuarine	CA	OR	WA	NV	AZ	Baja		
Nemata		X	X	X	X	X	X	X	X	X	X	Poinar (2001)	Fresh and brackish; excluded from benthic datasets

Literature Cited

Mollusca

Phylum: Mollusca

Standard Effort Level I: Genus

Standard Effort Level II: Genus/ Species

Standard Taxonomic Reference: Dillon (2006), Burch (1972), Nedeau et al. (2006)

Reviewed by:

The freshwater mollusks of western North America have a long and convoluted taxonomic history, with much confusion in the literature. Snails should be identified using Dillon (2006). Since the 1980s most workers have followed Burch's (1982, and various iterations thereafter) book on freshwater gastropods, wherein he made many taxonomic changes. However, Burch's work was not peer reviewed, nor published in the peer reviewed literature. For that reason, we follow Hubendick (1951) for the genus *Lymnaea*, Clarke (1981) for *Valvata*, Henderson (1929) for *Juga*, and Baker (1945) for the Planorbidae.

For the bivalves, the Burch (1972) keys remain the best available for the sphaericean clams. Freshwater mussels west of the continental divide are easily separated using Nedeau et al. (2006).

The freshwater snails, clams and mussels are ecologically significant, and their taxonomic relationships are poorly understood. Immature animals are not identifiable due to the tremendous amount of convergence in juvenile forms, and many groups cannot be identified beyond genus level without dissection. Non-native invasive species, particularly the asian clam, *Corbicula*, and the New Zealand Mudsnail, *Potamopyrgus* are ecological threats. Montana State University provides a webpage with useful information on the taxonomy and ecology of *Potamopyrgus*.

Annelida

Phylum: Annelida

Standard Effort Level I: Class

Standard Effort Level II: Oligochaeta and Branchiobdella to class, Hirudinea to genus, Polychaeta to species.

Standard Taxonomic References: Kathman and Brinkhurst (1998), Brinkhurst and Gelder (2001), Klemm (1972), Foster (1972)

Reviewed by:

Annelids are generally identified using Kathman and Brinkhurst (1998) or Brinkhurst and Gelder (2001). Hirudinea can be identified using Davies and Govedich (2001), Klemm (1972) and Klemm (1995). Polychaetes are best identified using Foster (1972).

Branchiobdella are typically excluded from CSBP bioassessment samples as they are commensals on crayfish (see STE Rules section 3.4.3).

Acari: Mites**Standard Effort Level I&II:** Genus (where possible)**Standard Taxonomic Reference:** Smith et al. (2001)**Reviewed by:**

This section remains relatively unchanged since the previous revision of the STE. The standard text is the chapter in Thorp and Covich (Smith et al., 2001), which provides keys to mature and immature specimens. Cook (1974) is an excellent source for detailed illustrations to supplement the newer key. The information in the table below reflects material identified from benthic samples from California streams (primarily by the ABL and SNARL), and should not be taken as an authoritative list.

Crustacea

Subphylum: Crustacea

Standard Effort Level I: Genus

Standard Effort Level II: Genus/Species

Standard Taxonomic Reference: Rogers (2005)

Reviewed by:

The Crustacea are best separated using the keys in Rogers (2005) and literature cited therein. Crustaceans are important in bioassessment: mysids, amphipods and isopods are sensitive to many pollutants and heavy metals, most crayfish and freshwater crabs are invasive species, and there are several state and federally protected species.

In Napa, Sonoma and Marin counties in California, many streams and rivers are occupied by the California Freshwater Shrimp (*Syncaris pacifica*), which is both a state and federally protected species. In temporary pools and streams in the Agate Desert area in southern Oregon, and California's Great Central Valley and the southern California coastal counties are five federally protected fairy shrimp and one federally protected tadpole shrimp. These animals are protected under the state and federal Endangered Species Acts and the California Environmental Quality Act. Any individual, private company or agency that violates these laws may be subject to substantial fines, imprisonment, or both.

Collembola

Collembola: Springtails

Standard Effort Level I: Rejected from benthic datasets

Standard Effort Level II: Rejected from benthic datasets

Standard Taxonomic Reference: Christiansen and Snider (1996)

Reviewed by:

Collembolans can be identified to genus using the key in Merritt and Cummins (Christiansen and Snider, 1996) or Hilsenhoff (2001). Collembola live neustonically or near any aquatic or moist habitat including stream and pond margins, intertidal pools, watersoaked wood and carpet and even in human skin (Altschuler et al., 2004). Collembola are generally rejected from benthic datasets.

Taxonomic Hierarchy		Habitat				Distribution						Literature Cited		Comments

Ephemeroptera

Ephemeroptera: Mayflies

Standard Effort Level I: Genus

Standard Effort Level II: Species (where possible)

Standard Taxonomic Reference: Edmunds and Waltz (1996)

Reviewed by: Joseph Slusark

Nymphs can be identified to genus using the key in Merritt and Cummins (Edmunds and Waltz, 1996). Considerable reorganization of the baetid genera has taken place since the key was published (Lugo-Ortiz and McCafferty, 1998). A mayfly workshop was given by the Northwest Biological Assessment Workgroup in 2005. The manual created by Jacobus and Randolph (2005) serves as a very useful supplementary text with numerous provisional keys and unpublished distributional and habitat information for western mayflies. There are two useful websites on Ephemeroptera: Mayfly Central, hosted by Purdue University, maintains the Mayflies of North America checklist and has distributional information, and; Ephemeroptera Galactica, hosted by the Museum Collections of Aquatic Entomology at Florida A&M University, has a bibliography that offers many mayfly paper PDFs.

Odonata

Odonata: Damselflies and Dragonflies

Standard Effort Level I: Genus

Standard Effort Level II: Species (where possible)

Standard Taxonomic Reference(s): Westfall and May (1996), Needham, Westfall and May (2000)

Reviewed by: Rosser W. Garrison, Andrew Rehn

Keys to families and genera are given in the odonate chapter of Merritt and Cummins (Westfall and Tennessen, 1996). Updated keys, species keys to adults and immatures are given for damselflies in Westfall and May (1996) and dragonflies in Needham, Westfall and May (2000). See Rehn (2000) for more detailed ecological and distributional information on Californian odonates. Kennedy (1917) and Paulson and Garrison (1977) provided considerable distributional information for the Pacific Coast region.

Plecoptera

Plecoptera: Stoneflies

Standard Effort Level I: Genus

Standard Effort Level II: Species (where possible)

Standard Taxonomic Reference: Stewart and Stark (2002)

Reviewed by: John B. Sandberg

Nymphs may be identified to family and genus using Stewart and Stark (2002) or the chapter in Merritt and Cummins (Stewart and Harper, 1996), which also provides keys to adults. Although species keys exist for the adults of many families and genera in the West, many nymphs remain undescribed. Early instar nymphs of Capniidae can be very difficult to identify to genus; it is recommended that only mature nymphs be identified beyond Capniidae. Many genera and species of Capniidae, Leuctridae, Nemouridae and Taeniopterygidae are underrepresented in benthic samples because they emerge during the winter months or they prefer ephemeral habitats. Jewett (1959, 1960) are good sources of information on adult taxonomy. A current species list and distribution for stoneflies, The North American Stonefly List, is maintained by B.P. Stark and R.W. Baumann on the Monte L. Bean Museum website.

Taxonomic Hierarchy					Species	Habitat		Estuarine	Distribution					Literature Cited	Comments

Hemiptera

Hemiptera (Suborder Heteroptera): True Bugs

Standard Effort Level I: Genus

Standard Effort Level II: Species

Standard Taxonomic Reference(s): Polhemus (1996)

Reviewed by: John T. Polhemus

Keys to families and genera are provided in Merritt and Cummins (Polhemus, 1996). The best regional text for all families remains Menke (ed.) (1979), which gives keys to all genera and species then known to occur in California. Stonedahl and Lattin (1986) surveyed the Corixidae for Oregon and Washington. This revision of the STE includes only those families which are truly aquatic (all Nepomorpha, except Gelastocoridae and Ochteridae) and excludes all Gerrromorpha and Leptopodomorpha. The Notonectidae and Pleidae, which are included in this list, are generally rejected from benthic datasets.

Megaloptera

Megaloptera: Dobsonflies and Alderflies

Standard Effort Level I: Genus

Standard Effort Level II: Genus

Standard Taxonomic Reference: Evans and Neunzig (1996)

Reviewed by: Norman Penny

Larvae may be identified to genus using the key in Merritt and Cummins (Evans and Neunzig, 1996). Early instar corydalids are best left at family since head color patterns generally do not develop until later instars. Evans's (1972) unpublished dissertation provides a species key to western megalopteran larvae, although the key does not include one species of *Sialis* and three species of *Protochauliodes*. Keys to adults as well as distributional and ecological information may found in the sources listed below. The Bibliography of the Neuroptera website is a useful resource and provides many downloadable PDFs of Megaloptera and Neuroptera literature.

Neuroptera

Neuroptera: Spongillaflies

Standard Effort Level I: Genus

Standard Effort Level II: Genus

Standard Taxonomic Reference: Evans and Neunzig (1996)

Reviewed by: Norman Penny

Larvae may be identified to genus using the key in Merritt and Cummins (Evans and Neunzig, 1996). Bowles (2006) provides a species key to larvae, although there is only one species in each genus found in the region. Larvae feed on and live in conjunction with freshwater sponges. Several other Neuroptera families occur in the region and their larvae occasionally show up in benthic samples. Tauber (1991) provides a key to North American Neuroptera larvae. The Bibliography of the Neuropterida website is a useful resource and provides many downloadable PDFs of Megaloptera and Neuroptera literature.

Trichoptera: Caddisflies

Standard Effort Level I: Genus

Standard Effort Level II: Species (where possible)

Standard Taxonomic Reference: Wiggins (1996a)

Reviewed by: David E. Ruiter, Robert W. Wisseman

Keys to families and genera are given in Wiggins (1996a) as well as the chapters in Merritt and Cummins (Wiggins, 1996b; Morse and Holzenthal, 1996). Wiggins (2004) provides updated family keys for larvae, pupae and adults as well as providing a wealth of behavioral and ecological information. Distributional information comes from original sources. Blinn and Ruiter (2005) gives a preliminary checklist for Arizona. The Trichoptera World Checklist website maintained by John C. Morse at Clemson University is a good source for information.

Larvae for many genera are not identifiable to species because some remain undescribed. Larvae and pupae can sometimes be reared to adults and thus identified to species, but only if living specimens are collected. For preserved specimens, well-developed, pharate pupae can sometimes be identified to species by using the metamorphotype method (Milne, 1938). In this case, the genitalia of a pharate pupa can be observed through the pupal cuticle and the specimen identified using keys and descriptions of the adult.

There are presently 19 recognized species groups of *Rhyacophila* known from the region covered by this list. Of these, 14 species groups have at least one representative species described as larvae in the peer-reviewed literature. These citations can be found in the list under the literature cited column for each species group. Ross (1956) and Schmid (1970) assigned most of the known *Rhyacophila* species to species groups based on adult characteristics. Three as yet unpublished but disseminated works (Wold, 1973; Smith, draft key and Wisseman, draft key) have further dealt with *Rhyacophila*, illustrating or describing larvae for most of the species groups. Associative material now exists for 4 of the remaining 5 species groups, leaving only larvae from the *Rhyacophila viquaea* group as undescribed and unassociated. Since the metamorphotype method may be used to identify pupae to any of these species groups based on the adult morphology and taxonomy, all 19 species groups names have been included in this version of the STE List (see STE Rules, section 3.2.3). However, at this time we recommend not using the following species group names for larval identifications until formal descriptions appear in the peer reviewed literature: *ecosa* group, *rayneri* group, *vemna* group, *viquaea* group and *vofixa* group.

Lepidoptera

Lepidoptera: Moths and Butterflies

Standard Effort Level I: Genus for *Parapoynx* and *Petrophila*, otherwise Order

Standard Effort Level II: Genus for *Parapoynx* and *Petrophila*, otherwise Order

Standard Taxonomic Reference: Lange (1996)

Reviewed by: Allison R. Brigham

Larvae of *Parapoynx* and *Petrophila* may be identified to genus using the key in Merritt and Cummins (Lange, 1996). This key and others for aquatic Lepidoptera should be used with caution for specimens collected in bioassessment samples. Careful collecting of Lepidoptera larvae to preserve case integrity and to record host-plant association is required to eliminate accidentals (e.g., terrestrial or riparian taxa). The key presented in Stehr and Martinat (1987) is a more complete guide to the families of North American Lepidoptera.

Coleoptera

Coleoptera: Beetles

Standard Effort Level I: Genus

Standard Effort Level II: Species (where possible)

Standard Taxonomic Reference: White and Brigham (1996), Larson et al. (2000) (Dytiscidae), Shepard (2002) (Elmidae)

Reviewed by: Cheryl B. Barr (Byrrhoidea), Eric G. Chapman (Haliplidae), Doug Post (Dytiscidae), William D. Shepard (Byrrhoidea)

Aquatic beetles (larvae and adults) can generally be identified to genus using the keys in Merritt and Cummins (White and Brigham, 1996). Adults can be identified to genus using the keys in Arnett and Thomas (2001) and Arnett et al. (2002). Although designed for the Florida beetle fauna, Epler (1999) is a useful resource. Larson et al. (2000) should be used for all generic dytiscid identifications. For specimens from the Southwest, other supplementary references may be required for species identifications. Post (2005) put together an excellent guide to California dytiscids. Challet and Brett (1998) is very useful for dytiscid distributions within California. An undescribed elmid genus, which is being described by Cheryl Barr, is known to occur throughout the Pacific Northwest. Shepard (1993) gives some habitat and ecological information for this genus. Brown (1972a) is still the best source for elmid species keys. The keys in White and Brigham (1996) for the Chrysomelidae, Staphylinidae and Curculionidae should be used with caution since each of these families have very few truly aquatic representatives – none benthic – but many terrestrial genera. The inclusion of these genera in White and Brigham (1996) for these families makes the assumption that the specimens being keyed are definitely aquatic, thus excluding the possibility of accidental terrestrials. This caveat also applies to a number of other families that have riparian or strictly terrestrial adults.

Diptera: True Flies**Standard Effort Level I:** Genus (where possible) -- Chironomidae to family**Standard Effort Level II:** Genus (where possible) -- Chironomidae to genus**Standard Taxonomic Reference:** Merritt and Cummins (1996)**Reviewed by:**

Keys to families and genera are given in Merritt and Cummins (Courtney et al., 1996 – larvae; Merritt et al., 1996 – pupae and adults; Byers, 1996 – Tipulidae; Peterson, 1996 – Simuliidae; Walker and Newson, 1996 – Culicidae; Coffman and Ferrington, 1996 – Chironomidae). Stone et al. (1983) is a good source for distributional information. See also McAlpine et al. (1981, 1987, 1989) for additional keys, illustrations, biological and phylogenetic information and bibliographic references for all Diptera families. The Simuliidae have recently been revised for North America (Adler et al., 2004) When identifying chironomids, it may be helpful to have a number of additional texts at hand including Wiederholm (1983), Wiederholm (1986), and Epler (2001). The latter text, although designed for use in North and South Carolina, is well illustrated and has up-to-date keys for many Nearctic genera. It also contains useful information on the hazards of midge larva identification including ecology, nomenclature, slide-mounting, and quality assurance.
